

Part 4: Ethical Reflection (5%)

In my future AI projects—particularly those involving predictive analytics, text classification, or user-generated data—I plan to integrate ethical AI principles at every stage of the development process. First, I will prioritize fairness by carefully examining datasets for imbalance or biased labeling. For example, if I build a model to analyze social-media trends or classify sentiment, I will check whether certain groups, topics, or languages are underrepresented and apply techniques such as rebalancing, reweighting, or bias detection tools to mitigate this.

Second, I will ensure transparency and explainability by documenting all model decisions, data sources, preprocessing steps, and limitations. When possible, I will use interpretable models or provide post-hoc explanations (e.g., SHAP values) so that users and stakeholders can understand why the system outputs specific results.

Third, I will uphold privacy and data protection. This includes collecting only the data that is necessary, anonymizing personally identifiable information, and following strict security practices when storing or processing user data. If I work with sensitive data—such as user posts, images, or personal identifiers—I will ensure proper consent and compliance with data-protection requirements.

Fourth, I will maintain accountability by setting up clear monitoring procedures. I will continuously evaluate the model for performance drift, unfair outcomes, or unintended consequences, and I will implement a mechanism that allows human oversight and correction when errors occur.

Finally, I will consider the broader social impact of my system by asking whether the application benefits users, avoids harm, and aligns with responsible use. If I identify risks—such as reinforcing stereotypes or enabling intrusive surveillance—I will redesign or limit the system's deployment.

By integrating fairness, transparency, privacy, accountability, and social responsibility into my workflow, I will ensure that any AI system I develop aligns with ethical principles and contributes positively to users and society.
